

# Topology Notes

---

## Design focus

- Separate users, services, and core network roles clearly.
- Ensure the services can be tested from the client side.
- Keep the addressing and service relationships easy to validate.

## Main components

- Client workstations
- Network devices
- DHCP service
- DNS service
- HTTP service
- AAA authentication service

## Validation intent

The topology was designed so that addressing, resolution, service access, and authentication could all be checked from the user perspective.
